

Java-Developer in a start-up in Potsdam (working student/internship)

We are a young FarmTech company financed by Venture Capital and develop an innovative sensor-based monitoring system for dairy farms. Our sensor system allows the farmer to gather the health situation of his dairy cows on a daily basis and to react to deviations in health at an early stage.

For the area of UI-development and UX-design we are currently looking for an intern and/or a working student. You can expect a small, agilely working, highly motivated team and you can take responsibility right from the beginning and you will be supported by our experienced senior developers:

What you should bring:

- First experiences in web design and/or visualization of data
- Interest in handling Java, JavaScript/jQuery and MySQL-databases
- Motivation to learn crossbrowser development as well as optimizing for mobile terminal devices is of advantage
- Of advantage: basic knowledge in pattern recognition as well as experience with Maven, Spring, Hibernate, Bootstrap
- Lateral thinking combined with flexibility and team spirit is beneficial

If you enjoy functional, pragmatic work in interdisciplinary teams in a dynamic environment you will surely like our young company. You will be working independently, and you will have maximal freedoms conceptualizing and designing the software.

We provide a flat hierarchy, creative freedom and responsible tasks. A free organisation of working hours and workplace as well as the perspective for a permanent position with the participation in business success are part of our business culture.

We are looking forward meeting you!
